

PROJECT STRUCTURE

Types of Project Organizational Structures. There are three types of organizational structures in project management: functional, matrix, and projectized. Each project structure framework is determined by the authority, roles, and responsibilities of the team members within the existing organizational structure. Here are two examples of project structures. A company is organising an exhibition event. For this event, there are two main areas set up as projects, putting on the exhibition and advertising the event. For the exhibition project, there are groups for expenditure and revenue.
