THIRD PARTY APIS

Third party APIs are APIs provided by third parties — generally companies such as Facebook, Twitter, or Google — to allow you to access their functionality via JavaScript and use it on your site. One of the most obvious examples is using mapping APIs to display custom maps on your pages. ou can call third-party REST APIs directly by using a filter having Set Fields action with REST API as a data source. This filter enables you to define a one-time configuration for the third-party REST API that you want to call in Remedy workflows. You can use different HTTP methods such as GET, PUT, POST, or DELETE.
